rejected.   The calling party receives a standard denial announcement with the appropriate wording.

All three of these CCS7-based services would be unbundled from other discretionary services and from one another (i.e., the only working service a customer must have to order one or more of these services is general exchange circuit-switched, line-side service). Since each of the services would be local services that work on the end user's line, all three services would be tariffed in the local exchange service tariffs within SWBT's five states (Arkansas, Kansas, Missouri, Oklahoma and Texas). It is currently anticipated that all three services would be offered for a flat rate, recurring charge as yet to be determined.

None of these services is currently being planned on the basis of demonstrated Enhanced Service Provider (ESP) market demand. Consequently, at this time these services do not appear to fit into the established ONA model. However, should it appear at any time that these services are being used to support enhanced services on any appreciable scale, SWBT would categorize them as Complementary Network Services (CNSs) within the Commission's ONA model, for all purposes.

B.   **ISDN-Derived Services**

1.   **DigiLine Service**

SWBT has introduced an ISDN-based service called DigiLine, which offers single-line ISDN transport and supplementary features to our customers. DigiLine service is provided using a Basic Rate Interface (BRI) architecture via a 144 Kbps facility.

This facility is typically divided into two 64 Kbps B channels and one 16 Kbps D channel. B channels can carry circuit-switched voice, circuit-switched data and/or packet-switched data, while the D channel carries out-of-band signaling for the BRI, and low speed packet-switched data.

DigiLine service provides access to and from the Public Switched Telephone Network (PSTN) for circuit-switched voice traffic. DigiLine also provides transmission of circuit-switched data and packet-switched data, both B and D channel, within the customer's serving central office. The types of applications that could be supported by DigiLine include Image Management and Distribution (i.e. Real Estate, Law Enforcement), Telemetry, Desktop Conferencing, Teleradiology, and Work At Home.

The service components of DigiLine include: (1) "Hardware" components, the Basic Interface Equipment (line card) and the Basic Interface Facility (loop), which are required for the technical operation of the service; (2) Network elements (transport options) which designate the circuit-switched and packet-switched options; and (3) software based optional features and feature packages from which DigiLine customers may choose.

Customers may select any combination of transport options within the limitations of the ISDN technology, i.e. one or two B channels configured for circuit-switching or high speed packet, and/or a D channel configured for low speed packet. Each transport option carries a separate monthly rate.

Optional features and feature packages also carry a monthly rate, and are designed to add functionality to the specific

transport options of DigiLine. The feature packages were designed based on SWBT's experience with customers' **expressed** **preferences** for certain features and functionality combinations. For example, the Standard Key Terminal Feature Package (which was designed for business customers using key terminal CPE which they wanted to have emulate--as closely as possible--Centrex-like service) consists of the following features: Hold, Drop, Transfer, Call Forwarding, Call Forwarding Don't Answer, Call Forwarding Busy Line, Three Way Conference Calling, and Speed Calling. To date, there has not been any demand by ESPs (or any other class of customers) to offer these features individually. Other features (e.g., Call Pick-Up, Automatic Callback on Busy, Hunt Groups) are offered individually because they were less frequently desired by the above described type of customer.

A tariff for DigiLine service has been filed in Texas; interim approval has been granted. Future plans include tariffing this service in SWBT's other states in 1992. DigiLine service is tariffed in the Integrated Services Tariff. This is a special new tariff which is designed for advanced, "premium" versions of services which might be substitutable for, or complementary with, other existing local exchange-type services. Therefore, like the original local exchange service tariffs, the Integrated Services Tariff will be exclusively a state tariff involving services that fall outside of the ONA model. The Integrated Services Tariff is generally reserved for multi-channel offerings over a single

facility. There are no use restrictions associated with this tariff and thus ESPs may purchase services therefrom.

2. SmartTrunk Service

SmartTrunk is an intraLATA, intrastate service that allows ISDN access over a 1.544 Mbps facility that uses Q.931 signaling between ISDN local central offices and Digital Private Branch Exchanges (DPBXs). This service is based on Integrated Services Digital Network (ISDN) Primary Rate Interface (PRI) technology. The service has three components: (1) loop and line card (flat rate); (2) variable number of derived B channels (priced per activated B channel); and (3) optional features, each available and priced separately.

A single PRI or SmartTrunk span typically has 23 64 Kbps B-channels for circuit switching voice or data and one 64 Kbps D-channel for signaling only. The base SmartTrunk service will consist of at least one PRI that will have 23 B-channels for handling a combination of Direct Inward Dial (DID), Direct Outward Dial (DOD), Foreign Exchange (FX) and tie-line (TIE) call types. In addition to the base SmartTrunk PRI, it is also possible to use more than one PRI link, and to support more than one PRI link with a single D channel. In such a serving scenario, the customer has access to all 24 DSOs in the second (and subsequent) PRIs.

SmartTrunk has unbundled, optional features to which the customer may choose to subscribe. Initially, these will include Dynamic Channel Allocation, Network Ring Again and Back-up D-channel. Other optional features, such as Calling Number Delivery

and Redirected Number Information, may be added as future product enhancements.

The optional, unbundled features of SmartTrunk are as follows:

-- **Dynamic Channel Allocation**, also referred to as Call-By-Call Service Selection or Integrated Services Access, will permit a PBX customer to designate the specific services/call types a B-channel will support on a per call basis (initially DID and DOD only). Currently, PBXs have dedicated access lines or trunks to the public telephone network. Each dedicated line has a specific call type that it can support. Some handle only incoming calls while others handle only out-going calls. Therefore, some of these dedicated access lines/trunks may be idle because there is not a demand for the service which that line/trunk supports. Dynamic Channel Allocation allows these idle lines/trunks to be allocated for use by services that are currently being demanded. This ability allows customers to gain flexibility and control over their trunking while realizing some efficiencies.

-- **Network Ring Again (NRAG)** extends the Ring Again feature found within most PBXs to other PBXs that are connected to the public telephone network from the same Southwestern Bell central office via SmartTrunk. Specifically, NRAG allows users of the PBX to be notified when a busy telephone station they have attempted to call

is no longer busy. (NOTE: this feature is currently only available with DMS-100 central offices.)

-- **Back-up D-channel**: the D-channel can carry the signaling for multiple PRIs. This allows a full 24 B-channels to be utilized on a PRI instead of the normal 23 (23B + D). However, should the D-channel fail, calls over the PRIs being controlled by that D-channel are lost. Back-up D-channel enhances the survivability of PRI links by providing a Back-up D-channel that automatically takes over in the event of a D-channel failure. This will allow the calls over the supported PRIs to continue. (NOTE: this feature is currently only available with DMS-100 central offices only.)

Since SmartTrunk is a "premium" form of typical PBX trunking arrangements--which are currently tariffed in the general exchange tariff--like DigiLink, SmartTrunk also will be tariffed in the SWBT Integrated Services Tariff which is described in Section (I) (B) (1) above.

3. <u>SWF-DS1 Service</u>

SWF-DS1 is a switched access service currently in preliminary evaluation stages. If an opportunity analysis indicates that SWBT should deploy the service, the likely target market would be end-user customers whose traffic is data-intensive, and who have communications requirements to multiple locations but insufficient traffic volumes to justify dedicated facilities.
